

# Variance Estimation for Crash Data in Before-After Studies

2006 Summer TexITE Meeting  
College Station  
June 24, 2006

Zhirui Ye  
Texas A&M University

## Background

- Before-After Studies
- Four-step Process (Hauer, 1997)
  - For a single entity:

## Background (cont'd)

- Four-step Process

- For a composite entity

- Step 1:

$$\hat{\lambda} = \sum_{i=1}^n \lambda_i, \quad \hat{\pi} = \sum_{i=1}^n \pi_i$$

- Step 2:

Poisson Assumption

For each entity, annual crash data fits a Poisson distribution over a long period.

$$\text{VAR}\{\hat{\lambda}\} \approx \hat{\lambda}, \quad \text{VAR}\{\hat{\pi}\} \approx \hat{\pi}$$

## Problem Identification

- Question

Poisson Assumption

$$\text{VAR}\{\hat{\lambda}\} \approx \hat{\lambda}, \quad \text{VAR}\{\hat{\pi}\} \approx \hat{\pi}$$

- Two Possible Situations

- Situation 1:

$$\lambda_i, \pi_i \sim \text{Poisson}()$$

➤ Different characteristics (geometries, traffic flow, etc.)

- Situation 2:

$$\hat{\lambda}_i = \lambda_i, \quad \hat{\pi}_i = \pi_i$$

## Problem Statement (cont'd)

- Possible Situations

- Situation 2:

$$P(X = \lambda_i = \hat{\lambda}_i) = \frac{e^{-\hat{\lambda}_i} * \hat{\lambda}_i^{\hat{\lambda}_i}}{\hat{\lambda}_i!}$$

## Methodology

- Bootstrap Resampling Method

(Efron and Tishirani, 1993 )

## Methodology (cont'd)

### • Algorithm of Variance Estimation

Collect crash data  $\chi = \{X_1, X_2, \dots, X_n\}$

Bootstrap resamples with replacement

$$\chi_1^* = \{X_1^*, X_2^*, \dots, X_n^*\} \Rightarrow S_1^* = \text{sum}(\chi_1^*)$$

$$\chi_2^* = \{X_1^*, X_2^*, \dots, X_n^*\} \Rightarrow S_2^* = \text{sum}(\chi_2^*)$$

...

...

$$\chi_B^* = \{X_1^*, X_2^*, \dots, X_n^*\} \Rightarrow S_B^* = \text{sum}(\chi_B^*)$$

Variance estimation

$$\text{VAR}\{S^*\} = \text{VAR}\{S_1^*, S_2^*, \dots, S_B^*\}$$

## Simulation Design

Draw a sample from a known distribution  
(Poisson, Negative Binomial, etc.)

$$\chi_i = \{X_1, X_2, \dots, X_n\}$$

Variance Estimation

From the known distribution:  $\text{VAR}\{S_i\}$

Using bootstrap:  $\text{VAR}\{S_i^*\}$

Repeat  $m=100$  times to obtain

$$\text{VAR}\{S_1\}, \text{VAR}\{S_2\}, \dots, \text{VAR}\{S_m\}$$

$$\text{VAR}\{S_1^*\}, \text{VAR}\{S_2^*\}, \dots, \text{VAR}\{S_m^*\}$$

Calculate ratios and variances

$$r_1 = \text{VAR}\{S_1^*\} / \text{VAR}\{S_1\}, \dots, r_m = \text{VAR}\{S_m^*\} / \text{VAR}\{S_m\}$$

$$E(r) = \sum_{i=1}^m r_i, \quad \text{VAR}\{r\} = \text{VAR}\{r_1, r_2, \dots, r_m\}$$

### Poisson Simulation Results

| Sample Size (1) | Mean Value (2) | Theoretical Sum (3) | Sample Sum (4) |       | Bootstrap Var. (5) |        | Ratio (6)   |      |
|-----------------|----------------|---------------------|----------------|-------|--------------------|--------|-------------|------|
|                 |                |                     | mean           | std.  | mean               | std.   | mean        | std. |
